Mobile App Design Audit

Web ↔ Mobile Alignment · Missing Screens · Recommendations

Source: Clusteer.zip / mobile/* (Claude Design output)

30+ screens across 11 sections · iOS + Android + Dark mode

May 2026 · Internal Design Review

1. Design System Token Alignment

The mobile design (theme.jsx) shares the same font stack and radius scale as the web app (globals.css), but several color tokens diverge. These must be unified before development begins to ensure pixel-perfect cross-platform consistency.

Token	Web (globals.css)	Mobile (theme.jsx)	Match?
Primary lime	#C9F542 (--c-lime-500)	#9FE870 (lightGreen)	MISMATCH
Background	#FAFAFA (--c-bg)	#FAFAFA (bg)	Yes
Surface	#FFFFFF (--c-surface)	#FFFFFF (surface)	Yes
Text primary	#21241D (--c-text)	#21241D (text)	Yes
Text muted	#4A5048 (--c-text-2)	#475467 (textMuted)	Close but different
Border / line	#E2DDD0 (--c-line)	#E9EAEB (border)	MISMATCH (warm vs cool)
Danger / down	#E5484D (--c-down)	#D92D20 (danger)	MISMATCH
Warm beige	#F0EBE6 (bg-warm-beige)	#F0EBE6 (surfaceWarm)	Yes
Display font	Sora	Sora	Yes
Body font	Inter	Inter	Yes
Mono font	JetBrains Mono	JetBrains Mono	Yes
Radius sm/md	10px / 14px	10 / 14	Yes
Dark BG	#131815 (--c-surface dark)	#121310 (bg dark)	Close but different
Dark surface	#131815	#1B1D17 (surface dark)	MISMATCH

Critical: The lime green (#C9F542 vs #9FE870) is the brand accent. Using two different limes across web and mobile will look like two different products. Recommendation: adopt the web's #C9F542 everywhere — it's bolder and better suits the neobrutalism brand language.

2. Screen Inventory (What Exists)

The mobile design covers 30+ screens across 11 sections. Here is the full inventory:

Section	Screens	iOS	Android	Dark
01. Brand Identity	App icon (4 variants), Lock screen, Home widget (small + medium)	Yes	—	Yes
02. Onboarding	3 variations (Bold / Premium / Storybook), Sign up, Login (biometric), OTP, Forgot password	Yes	—	—
03. KYC	Intro, Personal info, ID type, NIN entry, Selfie tips, Submitting, Success, Pending review, Rejected (9 screens)	Yes	—	—
04. Dashboard	3 variations (A Bold / B Premium / C Command center)	Yes	Yes (A)	Yes (A, B)
05. Buy USDT	2 amount entries (A dual-field / B keypad), Review, Processing, Success	Yes	Yes (A)	—
06. Sell & Swap	Sell amount, Sell success, Swap screen	Yes	—	—
07. Transfer	Receive (QR), Send recipient, Send amount, QR scanner, Withdraw to bank, Tx detail, History	Yes	—	—
08. Portfolio	Asset detail (USDT chart, BTC chart)	Yes	—	Yes (BTC)
09. Account	Notifications, Settings, Profile edit, 2FA setup, Help center, Live chat	Yes	—	Yes (Settings)
10. Edge States	Empty, Error, Loading skeletons	Yes	—	—
11. Android	Dashboard A, Buy amount A (Material 3 chrome)	—	Yes	—

3. Missing Screens (Design Gaps)

These screens exist on web or are referenced in the mobile Settings but have no mobile design:

3.1 High Priority — Auth & Security

Screen	Why It's Needed	Web Has It?
Reset password	Users who forgot password need to set a new one after clicking email link	Yes
Verify email	Post-registration email verification gate	Yes
2FA authenticator challenge	Enter 6-digit code from authenticator app (not SMS OTP — that exists)	Yes

3.2 High Priority — Money Flow Confirmations

Every money movement needs a review/confirmation step before execution. The Buy flow has this (BuyReview), but Sell, Send, Withdraw, and Swap do not. This is both a UX best practice and a regulatory requirement.

Screen	Current State	What's Needed
Sell review	Amount → Success (no confirm)	Add: bank picker + amount + fee + confirm button
Send confirmation	Amount → (implied send)	Add: recipient + amount + network fee + confirm
Withdraw review	Amount → (implied)	Add: bank + amount + fee + estimated arrival + confirm
Swap confirmation	Single screen, no review	Add: from/to amounts + rate + fee + confirm

3.3 Medium Priority — Settings Sub-screens

These are referenced as navigation targets in SettingsScreen but have no designs:

Screen	Referenced In	Description
Linked banks	Settings > Account > 'Linked banks'	List of verified bank accounts, add/remove
External wallets	Settings > Account > 'External wallets'	Saved blockchain addresses for quick send
Trusted devices	Settings > Security > 'Trusted devices'	List of devices with active sessions, revoke
Change password	Settings > Security > 'Change password'	Current password + new password form
Notification prefs	Settings > Preferences > 'Notifications'	Toggle push/email/SMS per notification type
Language picker	Settings > Preferences > 'Language'	Language selection (English default)
Transaction filters	History screen	Date range, status, type, asset filters

3.4 Low Priority — Future Features

Screen	Notes
Referral / invite friends	Not designed for web or mobile yet. Referral system in backend upgrade P6
Data export (NDPR)	Required for Nigerian data protection compliance. User requests their data
Admin mobile views	No mobile admin panel. Low priority — admin is desktop-first
Push notification permissions	First-time prompt explaining why push is needed
Biometric enrollment	Settings > enable Face ID / fingerprint — currently just a toggle

4. Android Coverage Gap

Currently only 2 of 30+ screens have Android (Material 3) frames: Dashboard A and Buy Amount A. The `android-frame.jsx` component is ready (status bar, app bar, gesture nav, keyboard), but the screens haven't been wrapped in it.

Recommended Android priority order:

Priority	Screens	Count
P0	Onboarding (1 variation), Sign up, Login, OTP	4
P1	KYC flow (Intro through Success)	7
P1	Dashboard (1 variation, light + dark)	2
P2	Buy flow (amount, review, success)	3
P2	Sell + Swap	3
P2	Transfer (receive, send, withdraw)	5
P3	Settings, Notifications, Help	3
P3	Edge states, Asset detail	4

Total: ~31 screens need Android frames.

5. Dark Mode Coverage Gap

Dark mode tokens exist in `theme.jsx` for all colors, but only 5 screens are shown in dark mode:

Has Dark Mode	Missing Dark Mode
Dashboard A	Onboarding (all 3 variations)
Dashboard B	Sign up, Login, OTP, Forgot password
Settings	KYC flow (all 9 screens)
Asset detail (BTC)	Buy flow (all 5 screens)
Lock screen	Sell, Swap (all 3 screens)
	Transfer (all 7 screens)
	Notifications, Profile, 2FA, Help, Chat
	Edge states (empty, error, loading)

Since the `ThemeProvider` and all `CT.dark` tokens are already defined, generating dark variants is mostly mechanical — wrap each artboard in .

6. Action Items

6.1. Unify lime green across platforms

Priority: CRITICAL

Pick #C9F542 (web, bolder, neobrutalism-native) as the canonical brand lime. Update mobile theme.jsx lightGreen and mediumGreen to match. This is the single most visible brand inconsistency.

6.2. Unify secondary color tokens

Priority: HIGH

Align textMuted (#4A5048 vs #475467), border (#E2DDD0 vs #E9EAEB), danger (#E5484D vs #D92D20), and dark surface values. Small differences compound into "feels like a different app."

6.3. Design 4 confirmation screens

Priority: HIGH

Sell review, Send confirmation, Withdraw review, Swap confirmation. Each should show: amounts, fees, recipient/bank, rate, and a prominent "Confirm" button. Pattern exists in BuyReview — replicate for other flows.

6.4. Design 3 missing auth screens

Priority: HIGH

Reset password, Verify email, 2FA authenticator challenge. These can mirror the web versions adapted to mobile viewport.

6.5. Design 7 Settings sub-screens

Priority: MEDIUM

Linked banks, External wallets, Trusted devices, Change password, Notification preferences, Language picker, Transaction filters. Use the existing Card + Row + TextField components.

6.6. Expand Android to full coverage

Priority: MEDIUM

31 screens need Material 3 frames. android-frame.jsx is ready. Prioritize auth + KYC + dashboard first.

6.7. Expand dark mode to full coverage

Priority: MEDIUM

Theme tokens exist. Wrap remaining 25+ artboards in mode="dark". Mostly mechanical but important for completeness.

6.8. Create a shared design token file

Priority: LOW (but prevents future problems)

Single source of truth (JSON or CSS custom properties) imported by both web globals.css and mobile theme.jsx. Prevents future drift.

Summary: 30+ screens designed, ~18 missing. Core flows (dashboard, buy, KYC) are solid. Main gaps: confirmation screens for money movements, auth edge cases, settings sub-pages, and platform/theme coverage. Color token unification is the single most impactful fix.
